

Do I need to worry about dental disease?

www.greystonesvet.ie

Dental disease affects up to 75% of dogs and cats. If neglected the process will continue and lead to:

- ➔ development of bad breath
- ➔ buildup of plaque and tarter
- ➔ inflammation, infection and regression of the gum (periodontal disease)
- ➔ root infection and toothache
- ➔ premature loss of teeth
- ➔ possible development of liver, kidney and heart disease

To help keep your cat and dog's teeth in good condition you should do the following:

- feed a commercial, good quality dried from 'word go' (we stock prescription oral hygiene foods if regular foods do not seem to help)
- avoid giving soft food / table scraps
- provide dental chews to dogs (we stock special enzyme impregnated chews for good dental hygiene)
- provide good quality chew toys to dogs
- try to get into a routine of tooth brushing using pet toothpaste
- if tarter continues to build up, book in for a descale and polish

We will routinely examine teeth and gums at your annual vaccination but please feel free to contact the vet hospital if you would like a free nurse dental check.

Here are some of the products we stock which may help
